2.0	03-11-2023	Updated as per M72B regulation

1 Introduction

The Finnish Trust Network (FTN) is a mechanism for connecting large scale, consumer-facing services with trusted identity and service providers in Finland. The FTN is a legal framework under which different notified IDP's are mandated to provide strong authentication services for citizens to access public and private services in Finland.

Danske Bank Identity Provider Services implements OpenID Connect Authorization Code flow authentication as per recommendations from FICORA in FTN OIDC profile. FICORA instructs the use of asymmetric public signing/encryption keys which needs to be exchanged beforehand between Service Provider or Broker and Danske Bank Identity Provider Service. Protection of customer identities is based on public key cryptography using RSA key pairs. These keys are used for signing and encrypting Id Token and signing of JWT assertion. Secure key exchange by Danske Bank Identity Provider Service is implemented based on FTN recommendations.

1.1 Abbreviations

FTN   Finnish Trust Network
OIDC   OpenID Connect
RSA   Public Key Cryptosystem (**Rivest–Shamir–Adleman**)
JWT   Json Web Token
SP   Service Provider
IdP   Identity Provider
JWKS   JSON Web Key Set

2 Key Exchange Process

Key exchange needs to be done between Service Provider (SP) / Broker and Danske Bank IdP Services.

2.1 Public key exchange from Danske Bank to SP/Broker

Danske Bank Identity Provider Service has exposed JWKS URI as below. This URI can be invoked to get Danske Bank IdP services public key. Danske Bank expects SP/Broker to fetch keys from this URI in regular interval to avoid issue in case of key renewed by Danske Bank.

https://userapi2.danskebank.com/prod/external/ftn/idp-oidc/signed-jwks

2.2 Public key exchange from SP/Broker to Danske Bank

Danske Bank expects to receive similar Signed JWKS URI or Keys via secure email from SP/Broker. Usage of Signed JWKS will remove manual intervention in case of key renewal. SP/Broker would be able to renew their keys and publish in Signed JWKS URI. It will be Danske Bank's responsibility to fetch keys in regular interval from this Signed JWKS URI provided by SP/Broker.

2.3 Key Exchange

The public keys used in signing and encryption are exchanged by reference (Signed JWKS URI).

The change of signing and encryption keys is done by adding the new key to published keyset in advance of its usage. Both the new and the old keys are concurrently present in the keyset at the time of key change. The new key MUST be published at least 10 (cache) minutes before starting the use of the key. The old key SHOULD be removed from the keyset when the new key has been taken in to use.

The private part of the key must be stored secretly by the issuing party. Only the public part of the key should be shared via Signed JWKS URI.

The public key should always be issued by globally recognized CA. Self-issued public key is not recommended by FICORA and will not be accepted.

Format	Data	Issuer
URI (Must be HTTPS)	GET https://userapi2.danskebank.com/prod/external/ftn/idp-oidc/signed-jwks	Danske Bank
URI (Must be HTTPS)	Address of Signed JWKS web page	Service Provider / Broker

2.4 Algorithms and Key sizes

FTN OIDC profile specifies the Cryptographic algorithms for JWT protection in the FTN in signing and encryption of messages.

Danske Bank Identity Provider implements RSASSA-PKCS1-v1_5 using SHA-256 algorithm for signing of messages.

Danske Bank Identity Provider implements RSA-OAEP algorithm using default parameters for key exchange.

Danske Bank Identity Provider implements A128GCM, AES GCM using 128-bit key algorithm for encryption of messages.

Other optional algorithms from FTN OIDC profile are not implemented if not separately and specifically agreed.

2.5 Key update and revocation

It will be issuer's responsibility to renew the RSA key pair in case the key is expired, or public key is compromised. Danske Bank recommends having expiration date to keys for security reasons.
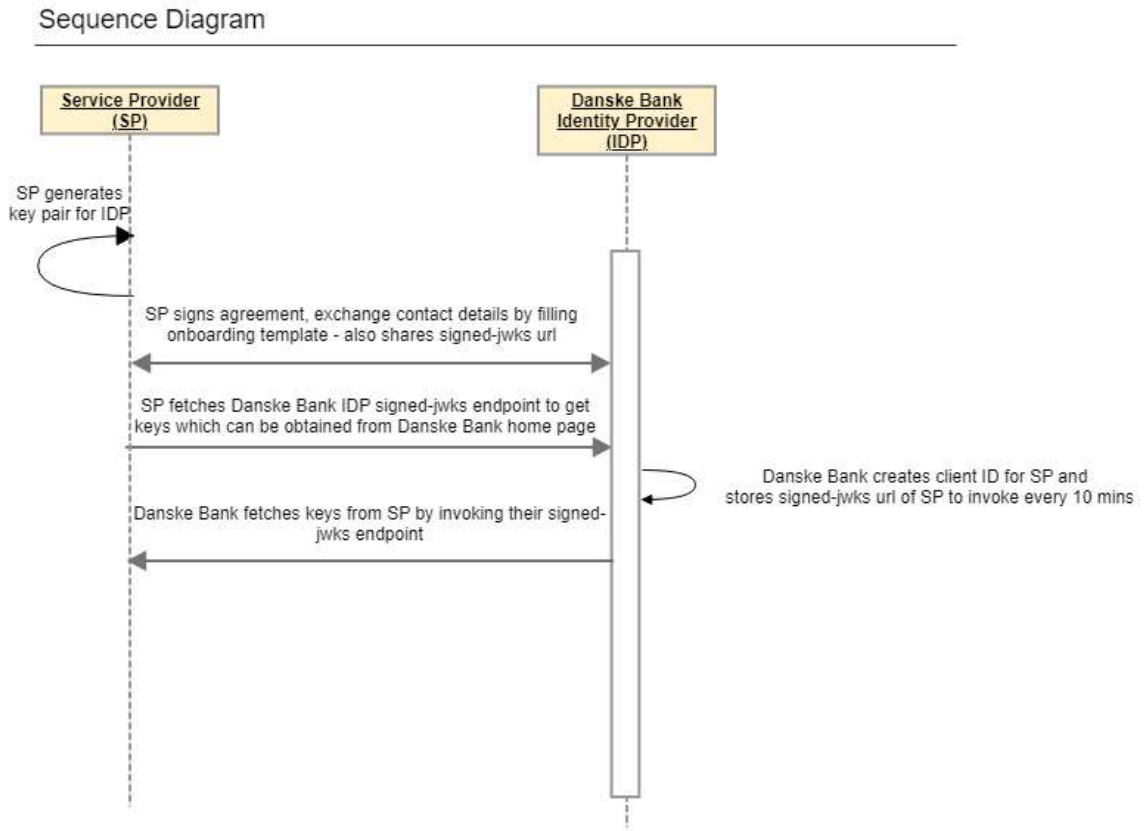

In case of expiration of keys, the key must be renewed in advance and new key should be published in the Signed JWKS URI along with existing key. Later after actual expiry of the keys the old key must be removed from Signed JWKS URI.

In case key is compromised, the issuer of the key should immediately remove the keys from Signed JWKS URI and replace it with new keys.

2.6 Key usage

Issuer	Key type	Usage
Service Provider / Broker	Private Key	This key will be used to sign the assertion JWT which is to be sent in token endpoint call.
Service Provider / Broker	Public Key	This key will be exposed to Danske Bank IdP's via Signed JWKS URI. This key will be used by Danske Bank IdPs to encrypt the identity token before sharing it with Service Provider. It will also be used to verify signature of assertion JWT sent by SP/Broker
Danske Bank IdP	Private Key	This key will be used by Danske Bank IdP to sign the identity token before it is encrypted using SP/Broker's public key.
Danske Bank IdP	Public Key	This key will be exposed to SP/Broker via Signed JWKS URI.

2.7 Sequence Diagram

Sequence Diagram

Service Provider (SP)

Danske Bank Identity Provider (IDP)

SP generates key pair for IDP

SP signs agreement, exchange contact details by filling onboarding template - also shares signed-jwks url

SP fetches Danske Bank IDP signed-jwks endpoint to get keys which can be obtained from Danske Bank home page

Danske Bank creates client ID for SP and stores signed-jwks url of SP to invoke every 10 mins

Danske Bank fetches keys from SP by invoking their signed-jwks endpoint
